(54) Alkaline proteases

(57) Provided are an alkaline protease wherein an amino acid residue at (a) position 84, (b) position 104, (c) position 256 or (d) position 369 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from: at position (a): an arginine residue, at position (b): a proline residue, at position (c): an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue, and at position (d): an aspartic acid residue; an alkaline protease wherein an amino acid residue at (e) position 66 or 264, (f) position 57, each of 101 to 106, 136, 193 or 342, (g) position 46 or 205, (h) position 54, 119, 138, 148 or 195, (i) position 247, (j) position 124, (k) position 107 or (l) position 257 has been deleted or selected from: at position (e): a glutamine, aspartic acid or like residue, at position (f): a lysine, serine or like residue, at position (g): a tyrosine

or tryptophan residue, at position (h): a tryptophan, phenylalanine or like residue, at position (i): a tryptophan, phenylalanine or like residue, at position (j): an alanine or lysine residue, at position (k): a lysine, arginine or like residue, and at position (l): a valine or isoleucine residue; a gene encoding the alkaline protease; a recombinant vector containing the gene, a transformant containing the recombinant vector, and a detergent composition containing the alkaline protease.

The present invention makes it possible to provide alkaline proteases having activity even in the presence of a high concentration of fatty acids, having high specific activity and detergency and being useful as an enzyme to be incorporated in a detergent.

Description

[0001] The present invention relates to alkaline proteases having high specific activity and strong oxidant resistance and as an enzyme to be added to a detergent, having excellent detergency.

5 [0002] Proteases have conventionally been used in a variety of fields such as various detergents including laundry detergents, cosmetics, bath agents, food modifiers, and pharmaceuticals such as digestion aids and anti-inflammatory agents. Among them, proteases for detergents are industrially produced in the largest amount and have a great market scale. A number of proteases are now put on the market.

10 [0003] In most cases, stains on clothes contain not only proteins but also plural components such as lipids and solid particles. There is accordingly a demand for detergents having detergency high enough to remove such actual complex stains. Finding, from such a viewpoint, alkaline proteases capable of retaining caseinolytic activity even in the presence of a high concentration of fatty acids and exhibiting excellent detergency even if the stain is composed of not a simple protein component but plural components, for example, protein and lipid, and having a molecular weight of about 43,000, the present inventors applied a patent (WO99/18218) on them.

15 [0004] Alkaline proteases superior to the above-described ones in specific activity, oxidant resistance and detergency and usable for detergents of wide-ranging compositions have however been requested.

20 [0005] The present inventors searched for such alkaline proteases mainly from enzyme variants. The above-described alkaline proteases are however utterly different in enzymological properties from serine proteases typified by subtilisin so that the modified site of subtilisin did not provide them with useful information. As a result of a further investigation, the present inventors have found that in order to obtain novel alkaline proteases having improved specific activity, stability against an oxidant and detergency while maintaining the properties of the above-described alkaline proteases, they must have a specific amino acid residue at a predetermined position of their amino acid sequence.

25 [0006] In one aspect of the present invention, there is thus provided an alkaline protease wherein an amino acid residue at (a) position 84, (b) position 104, (c) position 256 or (d) position 369 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from:

at position (a): an arginine residue,

at position (b): a proline residue,

at position (c): an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue, and

30 at position (d): an aspartic acid residue.

35 [0007] In another aspect of the present invention, there is also provided an alkaline protease wherein an amino acid residue at (e) position 66 or 264, (f) position 57, each of 101 to 106, 136, 193 or 342, (g) position 46 or 205, (h) position 54, 119, 138, 148 or 195, (i) position 247, (j) position 124, (k) position 107 or (l) position 257 of SEQ ID NO:1, or at a position corresponding thereto has been deleted or selected from:

at position (e): a glutamine, aspartic acid, serine, glutamic acid, alanine, threonine, leucine, methionine, cysteine, valine, glycine or isoleucine residue

40 at position (f): a lysine, serine, glutamine, phenylalanine, valine, arginine, tyrosine, leucine, isoleucine, threonine, methionine, cysteine, tryptophan, aspartic acid, glutamic acid, histidine, proline or alanine residue,

at position (g): a tyrosine, tryptophan, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, lysine, glutamine, methionine or cysteine residue,

at position (h): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, histidine, serine, lysine, glutamine, methionine, glycine, aspartic acid, proline, arginine or cysteine residue,

45 at position (i): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, glutamine, methionine or cysteine residue,

at position (j): an alanine or lysine residue,

at position (k): a lysine, arginine, alanine or serine residue, and

at position (l): a valine or isoleucine residue.

50 [0008] In a further aspect of the present invention, there are also provided a gene encoding the alkaline protease, a recombinant vector containing the gene and a transformant containing the vector.

[0009] In a still further aspect of the present invention, there is also provided a detergent composition containing the alkaline protease

55

FIG. 1 is a diagram illustrating detergency of an alkaline protease variant;

FIG. 2 is a diagram illustrating relative specific activity of each of alkaline protease variants, and FIG. 3 is a diagram illustrating relative residual activity of each of alkaline protease variants after treatment with an oxidant.

[0010] As described above, in the alkaline proteases of the present invention, an amino acid residue at (a) position 84, (b) position 104, (c) position 256 or (d) position 369 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from: at position (a): an arginine residue, at position (b): a proline residue, at position (c): an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue, and at position (d): an aspartic acid residue; or an amino acid residue at (e) position 66 or 264, (f) position 57, each of 101 to 106, 136, 193 or 342, (g) position 46 or 205, (h) position 54, 119, 138, 148 or 195, (i) position 247, (j) position 124, (k) position 107 or (l) position 257 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from: at position (e): a glutamine, aspartic acid, serine, glutamic acid, alanine, threonine, leucine, methionine, cysteine, valine, glycine or isoleucine residue, at position (f): a lysine, serine, glutamine, phenylalanine, valine, arginine, tyrosine, leucine, isoleucine, threonine, methionine, cysteine, tryptophan, aspartic acid, glutamic acid, histidine, proline or alanine residue, at position (g): a tyrosine, tryptophan, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, lysine, glutamine, methionine or cysteine residue, at position (h): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, histidine, serine, lysine, glutamine, methionine, glycine, aspartic acid, proline, arginine or cysteine residue, at position (i): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, glutamine, methionine or cysteine residue, at position (j): an alanine or lysine residue, at position (k): a lysine, arginine, alanine or serine residue, and at position (l): a valine or isoleucine residue.

[0011] Specifically, the alkaline proteases according to the present invention mean alkaline proteases having an amino acid sequence represented by SEQ ID NO:1 wherein the amino acid residue at a position selected from the above-described (a) to (d) and (e) to (l) has been deleted or predetermined, or another alkaline protease wherein the amino acid residue at a position corresponding thereto has been deleted or predetermined. They may be wild type enzymes, wild type variants or artificial variants.

[0012] The "another alkaline protease" may be a wild type enzyme or a wild type variant. That having oxidant resistance and having a molecular weight, as determined by SDS-PAGE, of $43,000 \pm 2,000$ is preferred, of which that having an amino acid sequence showing at least 60% homology with the amino acid sequence of SEQ ID NO:1 is more preferred. Particularly preferred is that having an amino acid sequence showing at least 60% homology with the amino acid sequence of SEQ ID NO:1, having oxidant resistance, works on the alkaline side (pH 8 or greater), is stable with at least 80% residual activity when treated at pH 10 for 10 minutes even at 50°C, is inhibited by diisopropyl fluorophosphate (DFP) and phenylmethane sulfonyl fluoride (PMSF) and has a molecular weight, as determined by SDS-PAGE, of $43,000 \pm 2,000$. The term "having oxidant resistance" as used herein means that it has at least 50% of residual activity (synthetic substrate assay) when treated in a 50 mM hydrogen peroxide solution (containing 5 mM calcium chloride) at pH 10 (a 20 mM Britton-Robinson buffer) at 20°C for 20 minutes.

[0013] Examples of the "alkaline protease having an amino acid sequence represented by SEQ ID NO:1" include KP43 [derived from *Bacillus* sp. strain KSM-KP43 (FERM BP-6532), WO99/18218], while those of the "alkaline protease KP9860 having an amino acid sequence represented by SEQ ID NO 2 [derived from *Bacillus* sp. strain KSM-KP9860 (FERM BP-6534), WO99/18218], Protease E-1 having an amino acid sequence represented by SEQ ID NO:3 [derived from *Bacillus* sp. strain No. D-6 (FERM P-1592), JP740710], Protease Ya having an amino acid sequence represented by SEQ ID NO:4 [derived from *Bacillus* sp. strain Y (FERM BP-1029), JP861210], Protease SD521 having an amino acid sequence represented by SEQ ID NO:5 [derived from *Bacillus* sp. strain SD-521 (FERM BP-11162), JP910821], Protease A-1 having an amino acid sequence represented by SEQ ID NO:6 (derived from NCIB12289, WO8801293), and Protease A-2 having an amino acid sequence represented by SEQ ID NO:7 (derived from NCIB12513, WO8801293). Of these, the amino acid sequences selected from SEQ ID NOS. 2 to 7 or alkaline proteases showing at least 80%, more preferably at least 90%, especially at least 95% homology therewith are preferred.

[0014] The homology of an amino acid sequence is calculated by Lipman-Pearson's method (Science, 227, 1435 (1985)).

[0015] The "amino acid residue at a corresponding position" can be identified by comparing amino acid sequences by using known algorithm, for example, that of Lipman-Pearson. The position of the "amino acid residue at a corresponding position" in the sequence of each protease can be determined by aligning the amino acid sequence of the protease in such a manner. It is presumed that the corresponding position exists at the three-dimensionally same position in the amino acid sequence of SEQ ID NO:1 and the amino acid residue existing at the same position brings about similar effects for a specific function of the protease.

[0016] Described specifically,

(a) the amino acid residue at position 84 of SEQ ID NO 1 is a lysine residue. By employing the above-described method, the amino acid residue at the position corresponding thereto can be identified as the lysine residue at position 83 of SEQ ID NO:3. This amino acid residue is preferably arginine.
 (b) Although the amino acid residue at position 104 of SEQ ID NO:1 is a leucine residue, this amino acid residue

or an amino acid residue corresponding thereto is preferably a proline residue.

(c) Although the amino acid residue at position 256 of SEQ ID NO:1 is a methionine residue, particularly preferred as this amino acid residue is an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue.

(d) Although the amino acid residue at position 369 of SEQ ID NO:1 is an aspartic acid residue, this amino acid residue or amino acid residue corresponding thereto is preferably an asparagine residue.

(e) Although the amino acid residue at position 66 or 264 of SEQ ID NO:1 is an asparagine residue, this amino acid residue is preferably a glutamine, aspartic acid, serine, glutamic acid, alanine, threonine, leucine, methionine, cysteine, valine, glycine or isoleucine residue, with an aspartic acid, serine or glutamic acid residue being particularly preferred. More preferred is the case wherein the amino acid residue at position 66 is an aspartic acid residue and that at position 264 is a serine residue.

(f) Although the amino acid residue at each of positions 57, 101 to 106, 136, 193 and 342 of SEQ ID NO:1 is a glycine residue, this amino acid residue is preferably a lysine, serine, glutamine, phenylalanine, valine, arginine, tyrosine, leucine, isoleucine, threonine, methionine, cysteine, tryptophan, aspartic acid, glutamic acid, histidine, proline or alanine residue. Particularly preferred is the case wherein the amino acid residue at position 57, 136, 193 or 342 is an alanine residue, or that at position 103 is an arginine residue.

(g) Although the amino acid residue at position 46 or 205 of SEQ ID NO:1 is a phenylalanine residue, this amino acid residue is preferably a tyrosine, tryptophan, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, lysine, glutamine, methionine or cysteine residue. Particularly preferred is the case wherein the amino acid residue at position 46 is a leucine residue.

(h) Although the amino acid residue at position 54, 119, 138, 148 or 195 of SEQ ID NO:1 is a tyrosine residue, this amino acid residue is preferably a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, histidine, serine, glutamine, methionine, glycine, aspartic acid, proline, lysine, arginine or cysteine residue. Particularly preferred is the case wherein the amino acid residue at position 195 is an alanine, aspartic acid, glutamic acid, glutamine, valine, tryptophan, glycine, lysine, threonine, methionine, cysteine, phenylalanine, proline, serine, arginine, asparagine or histidine residue.

(i) Although the amino acid residue at position 247 of SEQ ID NO:1 is a lysine residue, this amino acid residue is preferably a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, glutamine, methionine or cysteine residue. As the amino acid residue at position 247, an arginine or threonine residue is particularly preferred.

(j) Although the amino acid residue at position 124 of SEQ ID NO:1 is an arginine residue, this amino acid residue is preferably an alanine or lysine residue.

(k) Although the amino acid residue at position 107 of SEQ ID NO:1 is a leucine residue, this amino acid residue is preferably a lysine, arginine, alanine or serine residue, with a lysine residue being particularly preferred.

(l) Although the amino acid residue at position 257 of SEQ ID NO:1 is an alanine residue, this amino acid residue is preferably a valine or isoleucine residue, with a valine residue being particularly preferred.

[0017] With regards to "another alkali protease" which is preferred among the above-exemplified ones, positions corresponding to (a) to (d) and (e) to (l) of the amino acid sequence (SEQ ID NO:1) of Protease KP43 and specific examples of an amino acid residue are shown below (Table 1-a, Table 1-b).

Table 1-a

[0018] In the alkaline proteases of the present invention, deletion of an amino acid residue or selection in (a) to (d) or (e) to (l) may be conducted at two or more positions simultaneously.

[0019] When the alkaline protease of the present invention is a variant, the "protease having an amino acid sequence represented by SEQ ID NO:1" or the above-exemplified "another alkaline protease" serves as an alkaline protease prior to mutation (which may be called "parent alkaline protease"). By introducing mutation to a desired site of this parent alkaline protease, the alkaline protease of the present invention is available. For example, it is available by deleting or substituting, with another amino acid residue, the amino acid residue at a position selected from the above-described (a) to (d) and (e) to (l) of the amino acid sequence of SEQ ID NO:1 of Protease KP43 or at the corresponding position of the amino acid sequence of another alkaline protease, more specifically, amino acid sequence represented by SEQ ID NOS:2 to 7.

[0020] The alkaline protease of the present invention can be obtained, for example, by introducing mutation to a cloned gene encoding a parent alkaline protease, transforming a proper host by using the resulting mutated gene and then culturing the recombinant host. Cloning of the gene for encoding a parent alkaline protease may be carried out using an ordinary gene recombination technique for example, in accordance with the process as described in WO99/18218, JP901128 or WO98/56927.

[0021] For mutation of a gene encoding a parent alkaline protease, either one of random mutation or site-specific mutation which is prevalent now can be adopted. More specifically, mutation can be effected using, for example, "Site-Directed Mutagenesis System Mutan-Super Express Kit" of Takara Shuzo Co., Ltd. By using recombinant PCR (polymerase chain reaction) as described in "PCR protocols" (Academic Press, New York, 1990), a desired sequence of a gene can be replaced with a sequence of another gene corresponding to the desired sequence.

[0022] For production of the protease variant of the present invention by using the resulting mutated gene, usable is, for example, the following process. A DNA encoding the protease variant of the present invention is stably amplified by linking the mutated gene with a DNA vector capable of amplifying it stably or by introducing the mutated gene onto a chromosomal DNA capable of maintaining it stably and then, the gene is introduced into a host permitting stable and

efficient expression of the gene, whereby the variant protease is produced. Hosts satisfying the above-described conditions include microorganisms belonging to *Bacillus* sp., *Escherichia coli*, mold, yeast and *Actinomyces*.

5 [0023] The alkaline protease of the present invention thus obtained has stable protease activity in an alkaline region is free from the inhibition of caseinolytic activity by higher fatty acids, and has a molecular weight, as determined by SDS-PAGE, 43.000 ± 2.000 . For example the protease variant available from, as a parent strain, the protease having an amino acid sequence of SEQ ID NO:1 has the below-described physicochemical properties.

(i) Acting pH range

10 [0024] It acts in a wide pH range of from 4 to 13 and exhibits at least 80% of the optimum pH active value at pH 6 to 12.

(ii) Stable pH range

15 [0025] It is stable within a pH range of 6 to 11 under the treating conditions at 40°C for 30 minutes.

(iii) Influence of fatty acids

[0026] Its caseinolytic activity is not inhibited by oleic acid.

20 [0027] Such proteases of the present invention have excellent specific activity, oxidant resistance and detergency and are therefore useful as an enzyme to be incorporated in various detergent compositions. Particularly, the proteases wherein the amino acid residue at position (a) to (d) of SEQ ID NO:1 or at a position corresponding thereto has been deleted or specified are superior in detergency. Among them, those having, as the amino acid residue at (c) position 256 or at a position corresponding thereto, an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue have both high specific activity and strong oxidant resistance. The proteases wherein the amino acid residue at position (e) to (l) of SEQ ID NO:1 or at a position corresponding thereto has been deleted or specified have particularly excellent specific activity.

25 [0028] The above-described protease may be added to the detergent composition of the present invention in an amount sufficient to permit exhibition of its activity. Although 0.1 to 5000 P.U. can be added per 1 kg of the detergent composition, 1000 P.U. or less, preferably 500 P.U. is added in consideration of economy.

30 [0029] To the detergent composition of the present invention, various enzymes can be used in combination with the alkaline protease of the present invention. Examples include hydrolases, oxidases, reductases, transferases, lyases, isomerasers, ligases and synthetases. Of these, proteases, cellulases, lipases, keratinases, esterases, cutinases, amylases, pullulanases, pectinases, mannosases, glucosidases, glucanases, cholesterol oxidases, peroxidases, laccases and proteases other than the alkaline protease used in the present invention are preferred.

35 [0030] Proteases include commercially available Alcalase, Esperase, Savinase and Everlase (each, product of Novo Nordisk), Properase and Purafect (each, product of Genencor International Inc.), and KAP (Kao Corp.). Cellulases include Cellzyme and Carezyme (each, product of Novo Nordisk), KAC (Kao Corp.) and alkaline cellulase produced by *Bacillus* sp. strain KSM-S237 as described in Japanese Patent Application Laid-Open No. Hei 10-313859. Amylases include Termamyl and Duramyl (each, product of Novo Nordisk), Purastar (Genencor International Inc.), and KAM (Kao Corp.). Lipases include Lipolase and Liporase Ultra (each, product of Novo Nordisk). The above-exemplified enzyme may be incorporated in an amount of 0.001 to 10%, preferably 0.03 to 5%.

40 [0031] A surfactant may be incorporated in an amount of 0.5 to 60 wt.% (which will hereinafter be called "%", simply) in the detergent composition. To a powdery detergent composition and a liquid detergent composition, addition of 10 to 45% and 20 to 50% are preferred, respectively. When the detergent composition of the present invention is a bleaching detergent or automatic dishwasher detergent, the surfactant may usually be added in an amount of 1 to 10%, preferably 1 to 5%.

45 [0032] A divalent metal ion scavenger may be added in an amount of 0.01 to 50%, with 5 to 40% being preferred.

[0033] An alkali agent and inorganic salt may be added in an amount of 0.01 to 80%, preferably 1 to 40%.

50 [0034] An antisoil redeposition agent may be added in an amount of 0.001 to 10%, preferably 1 to 5%.

[0035] A bleaching agent (ex. hydrogen peroxide or percarbonate) is added preferably in an amount of 1 to 10%. Upon use of the bleaching agent, 0.01 to 10% of a bleaching activator can be added.

[0036] As a fluorescent brightener, biphenyl type ones (such as "Tinopal CBS-X") and stilbene type ones (such as DM fluorescent dye) can be used. It is added preferably in an amount of 0.001 to 2%.

55 [0037] The detergent composition of the present invention can be prepared in a conventional manner by using the alkaline protease obtained by the above-described process and the above-described known detergent components in combination. The detergent form can be selected according to the using purpose. Examples include liquid, powder and granule.

[0038] When the alkaline protease of the present invention is added to a powdery detergent composition, it is pre-

ferred to prepare detergent particles in advance and then mix therein the alkaline protease granules in accordance with the process as described in Japanese Patent Application Laid-Open No. Sho 62-25790 in order to avoid the contact of workers or end users with the enzyme upon preparation or use of the detergent or to prevent heat-induced deactivation or decomposition of the enzyme.

5 [0039] The detergent composition of the present invention thus available is usable as a laundry detergent, bleaching detergent, automatic dishwasher detergent, pipe cleaner and artificial tooth cleaner. Use as a laundry detergent, bleaching detergent or automatic dishwasher detergent is particularly preferred.

Example 1

10 [0040] Mutation was introduced at random into a protease structural gene of about 2.0 kb including a termination codon by the following manner. First, PCR was conducted using a primer capable of amplifying this 2.0kb. A PCR master mix contained 5 ng of a template DNA, 20 pmol of a phosphorylated primer, 20 nmol of each dNTP, 1 μ mol of Tris/HCl (pH 8.3), 5 μ mol of KCl, 0.15 μ mol of MgCl₂ and 2.5U TaqDNA polymerase, and its total amount was 15 adjusted to 100 μ L. After modification of the template by allowing it to stand at 94°C for 5 minutes, PCR was performed for 30 cycles, each cycle consisting of treatment at 94°C for 1 min, at 55°C for 1 min and at 72°C for 1.5 min. The PCR product was purified by "PCR product purification Kit" (product of Boeringer Manheim), followed by elution in 100 μ L of sterile water. With 1 μ L of the eluate, second PCR was conducted under conditions similar to those of the first PCR except for the template DNA. After completion of the second PCR, the PCR product was purified in a similar manner 20 to the first PCR, followed by elution in 100 μ L of sterile water.

25 [0041] The amplified DNA fragment was integrated in a vector by polymerase reaction using "LATAq" produced by Takara Shuzo Co., Ltd. Described specifically, after addition of 5 μ L of a buffer for LATAq (a 10-fold concentrate), 8 μ L of a dNTP solution and 0.5 μ L of LATAq DNA polymerase, and as a template, 20 ng of plasmid pHA64TS (having a protease structural gene linked with an expression vector pHA64) to 35 μ L of the purified eluate, the total amount was adjusted to 50 μ L. PCR reaction of the resulting liquid was carried out for 30 cycles, each consisting of treatment at 94°C for 1 min, 55°C for 1 min and 72°C for 4 min. By the subsequent ethanol precipitation, the PCR product was collected. This PCR product had a shape of a plasmid having a nick at the 5' prime end of the primer. Ligase reaction by T4 ligase (product of Takara Shuzo Co., Ltd.) was conducted to link this nick portion.

30 [0042] By using 10 μ L of this ligase reaction mixture, transformation of the *Bacillus subtilis* strain ISW1214 was conducted, whereby about 4×10^5 transformants were obtained. The resulting transformants of the strain ISW1214 were cultured on a skin-milk-containing medium (containing 1% skim milk, 1% bactotryptone, 1% sodium chloride, 0.5% yeast extract, 1.5% agar and 7.5 μ g/ml of tetracycline) and halo formation, which was presumed to reflect the protease secretion amount, was observed.

35 Example 2: Purification of an enzyme

40 [0043] The protease active fraction was prepared in the following manner. The transformants obtained in Example 1 was cultured at 30°C for 60 hours on a medium A (3% polypeptone S (product of Nippon Pharmaceutical), 0.5% yeast extract, 1% fish meat extract (product of Wako Pure Chemical Industries, Ltd.), 0.15% dipotassium phosphate, 0.02% magnesium sulfate 7 hydrate, 4% maltose and 7.5 μ g/ml of tetracycline). The supernatant of the thus-obtained cultured medium was added with ammonium sulfate to give 90% saturation, whereby salting-out of protein was caused. The sample obtained by salting-out was dissolved in a 10 mM tris HCl buffer (pH 7.5) containing 2 mM of calcium chloride. The resulting solution was dialyzed overnight against the same buffer by using a dialysis membrane. The fraction in the dialysis membrane was applied to DEAE Bio-Gel A (product of Bio-Rad Laboratories) equilibrated with a 10 mM tris HCl buffer (pH 7.5) containing 2 mM calcium chloride to collect the protease active fraction not adsorbed to the ion-exchanger. This active fraction was applied further to "SP-Toyopearl 550W" (product of Tosoh Corp.) equilibrated with the same buffer, followed by elution with a 0 to 50 mM sodium chloride solution, whereby a protease active fraction was obtained. The resulting fraction was analyzed by SDS-PAGE electrophoresis to confirm that the protease was obtained as substantially uniform protein. The protein concentration was measured in accordance with the method of Lowry, et al. (J. Biol. Chem. 193, 265-275(1981)) by using bovine serum albumin (product of Bio-Rad Laboratories) as a standard.

Example 3: Measuring method of protease activity

55 (1) Synthetic substrate assay

[0044] A decomposition rate was measured using a synthetic peptide made of Gln-Ala-Ala-Pro-Leu(A-A-P-L) as a substrate. Described specifically a 50 mM borate/KCl buffer (pH 10.5) containing each enzyme to be evaluated and

3 mM of Glt-A-A-P-L-pNA (product of Peptide Institute Inc) was kept at 30°C for 10 minutes and then, an absorbance at 420 nm was periodically measured. The peptide hydrolyzing activity was determined from an increasing ratio of the absorbance at 420 nm per unit hour. The protein was determined using a protein assay kit of Bio-Rad Laboratories.

5 (2) Natural substrate assay

[0045] After 1.0 mL of a 50 mM borate buffer (pH 10) containing 1% (w/v) of casein was kept at 30°C for 5 minutes. 10 0.1 mL of an enzyme solution was added and reaction was conducted for 15 minutes. To the reaction mixture, 2.0 mL of a reaction-stopping solution (0.11M trichloroacetic acid - 0.22M sodium acetate - 0.33M acetic acid) was added. The resulting mixture was allowed to stand at room temperature for 30 minutes and the filtered. The acid soluble protein in the filtrate was quantitatively determined by the modified method of Lowry, et al. Described specifically, after addition 15 of 2.5 mL of an alkaline copper solution [1% potassium sodium tartrate : 1% copper sulfate : 1% sodium carbonate = 1:1:100] to the filtrate, the resulting solution was allowed to stand at room temperature for 10 minutes. Then, 0.25 mL of a diluted phenol solution (a phenol reagent (product of Kanto Kagaku) diluted 2-fold with ion exchange water) was added. After the resulting mixture was kept at 30°C for 30 minutes, absorbance at 660 nm was measured. One enzyme unit was designated as a quantity of the enzyme for liberating the acid soluble protein hydrolysis product corresponding to 1 mmol of tyrosine for 1 min in the above-described reaction.

20 Example 4

(1) Preparation of granular detergent

[0046] Detergency of the detergent as described in Example 3 of WO99/29830 was evaluated. Described specifically, 25 465 kg of water was poured in a mixing tank of 1 m³ equipped with a stirring blade. After its water temperature reached 55°C, 48 kg of a 50% (w/v) aqueous solution of sodium dodecylbenzenesulfonate and 135 kg of a 40% (w/v) aqueous solution of sodium polyacrylate were added. After stirring for 15 minutes, 120 kg of sodium carbonate, 60 kg of sodium sulfate, 9 kg of sodium sulfite and 3 kg of a fluorescent dye were added. After stirring for further 15 minutes, 300 kg of zeolite was added. The mixture was stirred for 30 minutes to yield a uniform slurry (the slurry had a water content of 50 wt.%). By spraying this slurry from a pressure spraying nozzle disposed in the vicinity of the top of a spray drying 30 tower, base granules were obtained (a high temperature gas was fed to the spray drying tower at 225°C from the tower bottom and discharged from the tower top at 105°C).

[0047] Then, 15 parts by weight of a nonionic surfactant, 15 parts by weight of a 50 wt.% aqueous solution of sodium dodecylbenzenesulfonate and 1 part by weight of polyethylene glycol were mixed under heating to 70°C, whereby a mixture was obtained. In a Loedige mixer (product of Matsuzaka Giken Co., Ltd., capacity: 20L, equipped with a jacket), 35 100 parts by weight of the base granules obtained above were charged and stirring by a main shaft (150 rpm) and chopper (4000 rpm) was started. Warm water of 75°C was caused to flow in the jacket at 10 L/min, the mixture was charged therein in 3 minutes, and then stirring was conducted for 5 minutes. The surface of the detergent particles were covered with 10 parts by weight of crystalline aluminosilicate, whereby the final product of the granular detergent was obtained.

40 [Raw materials used]

Aqueous solution of sodium dodecylbenzenesulfonate: "Neopelex F65" (product of Kao Corp.)

[0048] Nonionic surfactant: "Emulgen 108KM" (product of Kao) added with 8.5 moles, on average, of ethylene oxide
Aqueous solution of sodium polyacrylate: having an average molecular weight of 10000 (prepared in accordance with the process as described in Example of Japanese Patent Publication No. Hei 2-24283)
Sodium carbonate: dense ash (product of Central Glass Co., Ltd.)

Zeolite: "Zeolite 4A" having an average particle size of 3.5 µm (product of Tosoh Corp)
50 Polyethylene glycol: "K-PEG6000" (average molecular weight of 8500, product of Kao Corp.)
Fluorescent dye: "Tinopai CBS-X" (product of Ciba Geigy)

(2) Preparation of granulated protease

[0049] From the alkaline proteases of the present invention and a purified preparation of a parent alkaline protease, 55 granulated protease was prepared based on the process as described in Japanese Patent Application Laid-Open No Sho 62-257990 (6PU./g)

(3) Measurement of dexterity

[0050] In 1L of an aqueous calcium solution (71.2 mg calcium carbonate/1L) adjusted to 20°C, 0.67 g of each of the detergent compositions as shown in Table 2 was dissolved. With the resulting solution, a test cloth ("EMPA117" - prepared by Swiss Federal Laboratories for Materials Testing and Research, blood/milk/carbon) cut into a piece of 6 x 6 cm was washed using a Terg-O-tometer (product of Ueshima Seisakusho) at 20°C and 100 rpm for 10 minutes. After rinsing and drying the brightness was measured using a spectrophotometer ("CM3500d", product of MINOLTA). A dexterity was calculated based on the below-described equation. The results are shown in Table 2.

$$Dexterity (\%) = \frac{\text{Brightness of the test fabric after washing} - \text{that before washing}}{\text{Brightness of the test fabric before soiling} - \text{that before washing}} \times 100$$

[0051] Measuring results of the dexterity of the protease variants obtained in Example 1 are shown in FIG. 1. The alkaline protease variants of the present invention each exhibited superior dexterity to wild type enzymes to which mutation had not been introduced.

Table 2

	Granular detergent		99.5						100
Dexterity (%)			38	38	36	36	34	31	23

Example 5

[0052] Measuring results, in accordance with the synthetic substrate assay or natural substrate assay, of protease activity of the protease variants obtained in Example 1 (the proteases modified at 195-position and 256-position amino acid residues, respectively was measured by the latter assay, while the other proteases were measured by the former assay) are shown in FIG. 2. The alkaline protease variants of the present invention exhibited high specific activity

Example 6

[0053] In 2 mL of a 100 mM borate buffer (pH 10.5) containing 3% of aqueous hydrogen peroxide, a 50 µl portion of each of the protease variants obtained by purification in Example 1 was added. The resulting mixture was allowed to stand at 30°C for 30 minutes. After addition of an adequate amount of catalase (product of Boehringer Manheim) to remove excess hydrogen peroxide, the residual protease activity was measured by the synthetic substrate assay. In FIG. 3, the residual activity after treatment with aqueous hydrogen peroxide is shown relative to the activity before treatment set at 100%.

[0054] The alkaline protease variants of the present invention exhibited higher oxidant resistance than the parent alkaline protease

[0055] The present invention makes it possible to provide alkaline proteases having activity even under a high concentration of fatty acids, having high specific activity, oxidant resistance and dexterity, and being useful as an enzyme to be incorporated in a detergent.

Claims

40 1. An alkaline protease wherein an amino acid residue at (a) position 84, (b) position 104, (c) position 256 or (d) position 369 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from:

45 at position (a): an arginine residue,
 at position (b): a proline residue,
 at position (c): an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue,
 and
 at position (d): an aspartic acid residue

50 2. An alkaline protease having an amino acid sequence represented by SEQ ID NO:1 or having an amino acid sequence showing at least 60% homology therewith, wherein an amino acid residue at (a) position 84, (b) position 104, (c) position 256 or (d) position 369 of SEQ ID NO:1 or at a position corresponding thereto has been deleted or selected from:

55 at position (a): an arginine residue,
 at position (b): a proline residue,
 at position (c): an alanine, serine, glutamine, valine, leucine, asparagine, glutamic acid or aspartic acid residue,
 and

at position (d): an aspartic acid residue

3. An alkaline protease wherein an amino acid residue at (e) position 66 or 264, (f) position 57, each of 101 to 106 136 193 or 342, (g) position 46 or 205, (h) position 54, 119, 138, 148 or 195, (i) position 247, (j) position 124, (k) position 107 or (l) position 257 of SEQ ID NO:1, or at a position corresponding thereto has been deleted or selected from:

at position (e): a glutamine, aspartic acid, serine, glutamic acid, alanine, threonine, leucine, methionine, cysteine, valine, glycine or isoleucine residue

at position (f): a lysine, serine, glutamine, phenylalanine, valine, arginine, tyrosine, leucine, isoleucine, threonine, methionine, cysteine, tryptophan, aspartic acid, glutamic acid, histidine, proline or alanine residue

at position (g): a tyrosine, tryptophan, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, lysine, glutamine, methionine or cysteine residue,

at position (h): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, histidine, serine, lysine, glutamine, methionine, glycine, aspartic acid, proline, arginine or cysteine residue,

at position (i): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, glutamine, methionine or cysteine residue,

at position (j): an alanine or lysine residue,

at position (k): a lysine, arginine, alanine or serine residue, and

at position (l): a valine or isoleucine residue.

4. An alkaline protease having an amino acid sequence represented by SEQ ID NO:1 or having an amino acid sequence showing at least 60% homology therewith, wherein an amino acid residue at (e) position 66 or 264, (f) position 57, each of 101 to 106, 136, 193 or 342, (g) position 46 or 205, (h) position 54, 119, 138, 148 or 195, (i) position 247, (j) position 124, (k) position 107 or (l) position 257 has been deleted or selected from:

at position (e): a glutamine, aspartic acid, serine, glutamic acid, alanine, threonine, leucine, methionine, cysteine, valine, glycine or isoleucine residue

at position (f): a lysine, serine, glutamine, phenylalanine, valine, arginine, tyrosine, leucine, isoleucine, threonine, methionine, cysteine, tryptophan, aspartic acid, glutamic acid, histidine, proline or alanine residue

at position (g): a tyrosine, tryptophan, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, lysine, glutamine, methionine or cysteine residue,

at position (h): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, histidine, serine, lysine, glutamine, methionine, glycine, aspartic acid, proline, arginine or cysteine residue,

at position (i): a tryptophan, phenylalanine, alanine, asparagine, glutamic acid, threonine, valine, leucine, isoleucine, histidine, serine, glutamine, methionine or cysteine residue,

at position (j): an alanine or lysine residue,

at position (k): a lysine, arginine, alanine or serine residue, and

at position (l): a valine or isoleucine residue.

5. An alkaline protease according to claim 2 or 4, wherein the amino acid sequence represented by SEQ ID NO:1 or amino acid sequence showing at least 60% homology therewith is an amino acid sequence selected from SEQ ID NOS: 2 to 7.

45 6. A gene encoding an alkaline protease as claimed in any one of claims 1 to 5.

7. A recombinant vector comprising a gene as claimed in claim 6.

8. A transformant comprising a recombinant vector as claimed in claim 7.

50 9. A transformant according to claim 8, wherein a microorganism is used as a host

10. A detergent composition comprising an alkaline protease as claimed in any one of claims 1 to 5.
